No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                     Score

Sequence 79, Application US/09475515A Patent No. 6602705

INFORMATION:

```
GENERAL INFORMATION:

GENERAL INFORMATION:

APPLICANT: BARNETT, Susan

APPLICANT: ETAN MEGEDE, Jan

APPLICANT: LIAN, Ying

APPLICANT: LIAN, Ying

APPLICANT: HARTOG, Karin

APPLICANT: HARTOG, Karin

APPLICANT: GEBER, Catherine

APPLICANT: GEBER, Christopher

ITILE OF INVENTION: MPROVED EXPRESSION OF HIV POLYPEPTIDES AND PRODUCTION

ITILE OF INVENTION: OF VIRUS-LIKE PARTICLES

FILE REFERENCE: 1621.002

CURRENT APPLICATION NUMBER: US/09/475,515A

CURRENT FILING DATE: 1999-12-30

NUMBER OF SEQ ID NOS: 90

No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.

(CHIR ) CHIRON CORP.

Polynucleotide encoding antigenic type C HIV Gag polypeptide or a HIV Env polypeptide and the polypeptide useful for immunizing a mammal especially human against HIV.

WPI; 2000-452401/39. Barnett S. Zur Megede

ď

Claim 1; Page 92; 113pp; English.

Expression cassettes comprising a polynucleotide encoding antigenic type C human immunodeficiency virus (HIV) Gag or Env polypeptides are useful in DNA immunization, generation of packaging cell lines and production of Gag- and/or Env-containing proteins. Synthetic Env and Gag expression cassettes exhibit increased potency for induction of cytotoxic T-lymphocyte (CTL) responses by DNA immunization. Gag of HIV-1 self-assemble into non-infectious virus-like particles which are used as a matrix for the proper presentation of an antigen entrapped or associated to the immune system of the host

                                                                                                                                                          Expression cassettes comprising a polynucleotide encoding antigenic type C human immunodeficiency virus (HIV) Gag or Env polypeptides are useful in DNA immunization, generation of packaging cell lines and production of Gag and/or Env-containing protesins. Synthetic Env and Gag expression cassettes exhibit increased potency for induction of cytotoxic T-lymphocyte (CTL) responses by DNA immunization. Gag of HIV-1 self-assemble into non-infectious virus-like particles which are used as a matrix for the proper presentation of an antigen entrapped or associated to the immune system of the host

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Expression cassettes comprising a polynucleotide encoding antigenic type C human immunodeficiency virus (HIV) Gag or Env polypeptides are useful in DNA immunization, generation of packaging cell lines and production of Gag- and/or Env-containing proteins. Synthetic Env and Gag expression cassettes exhibit increased potency for induction of cytotoxic T-lymphocyte (CTL) responses by DNA immunization. Gag of HIV-1 self-assemble into non-infectious virus-like particles which are used as a assemble into non-infectious virus-like particles which are used as a

Ulmer J,
                                                                                                         The invention relates to a method of raising an immune response in a host animal. The method of the invention comprises administering a microparticle that has an adsorbent surface to which a first biologically active macromolecule (e.g. a nucleic acid) has been adsorbed. The microparticle comprises a polymer microparticle of poly(alpha-hydroxy acid), a polyhydroxy butyric acid, a polycaprolactone, a polyorthoseter, a detergent, and submicron emulsion. The method/microparticle of the invention is useful for immunising a host animal against viral, bacterial or parasitic infections. The present DNA sequence encodes a HIV-1 p55gag polypeptide. (Updated on 29-AUG-2003 to standardise OS field)
                                                                                                                                                                                                                                                                      A microparticle to which a biologically active macromolecule is adsorbed, for use as a vaccine composition to treat viral, bacterial or parasitic infections, comprises a polymer microparticle, a detergent and a submicron emulsion.
                                                                                       Sequence
                                                                                                                                                                                                                                                                                                                                                                                                         28-SEP-2000; 2000US-0236105P.

                                                                                                                                                                                                                                                                                    The invention relates to a method of raising an immune response in a host animal. The method of the invention comprises administering a microparticle that has an adsorbent surface to which a first biologically active macromolecule (e.g. a nucleic acid) has been adsorbed. The microparticle comprises a polymer microparticle of poly(alpha-hydroxy acid), a polyhydroxy butyric acid, a polycaprolactone, a polyorthoester, a polycyanoacrylate, a detergent, and submicron emulsion. The method/microparticle of the invention is useful for immunising a host animal against viral, bacterial or parasitic infections. The present DNA sequence encodes a HIV-1 p55gag polypeptide. The expression cassettes comprise any of the HIV type C sequences encoding Gag, Pol, Vif, Vpr, Tat, Rev, Vpu, Env or Nef (I). (I) have immunostimulant activity and can be used in gene therapy. The HIV type C polymucleotides are useful in applications including DNA immunisation, generation of packaging cell lines, and production of HIV Type C proteins. The polymucleotides are particularly useful in gene therapy and DNA immunisation applications. ABL39942 to ABL40054 and ABB06204 to ABB06215 represent sequences used in the exemplification of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New polymucleotides encoding antigenic HIV Type C polypeptides, useful applications including DNA immunization or generation of packaging cell lines, particularly in gene therapy.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention describes expression cassettes comprising a polynucleotide sequence encoding a polypeptide comprising immunogenic HIV type C polypeptides. The expression cassettes comprise any of the HIV type C sequences encoding Gag, Pol, Vif, Vpr, Tat, Rev, Vpu, Env or Nef (I). (I) have immunostimulant activity and can be used in gene therapy. The HIV type C polynucleotides are useful in applications including DNA immunisation, generation of packaging cell lines, and production of HIV Type C proteins. The polynucleotides are particularly useful in gene therapy and DNA immunisation applications. ABL39942 to ABL40054 and ABB06204 to ABB06215 represent sequences used in the exemplification of the polynucleotides.
                                                                                                                                                                                                                                                                             Human

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to human immunodeficiency virus immunogens and CC their corresponding DNA molecules. An immunogen comprises a portion of CC gay protein of HIV from an HIV clade, parts of pl7 and p24, modified to C prevent N-terminal myristoylation; and a synthetic polypeptide comprising human cytotoxic T-lymphocyte (CTL) epitopes of HIV protein. This CC immunogen is designed to elicit an HIV-specific immune response in the bundles. The immunogen is useful in the preparation of a medicament such as vaccine to prevent or treat HIV infection in a human subject. The CC invention also relates to method of stimulating anti-HIV immune response in a human subject which comprises administering one or more times an amount of nucleic acid molecule sufficient to prime an immune response to the immunogen, or else may be packaged within a delivery means, such as a condified vaccinia virus Aukara (MVA) to boost the immune response to common portion of the immunogens. The present DNA sequence encodes human continuoseficiency virus A immunogen (HIV A) fusion protein construct. HIV A immunogen consists of about 73% of gag protein fused to a string of 25 partially overlapping human CTL epitopes. The gag domain of HIV A contains p24 and p17 in an order reversed to the viral gag p17-p24-p15
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match 'Best Local Similarity Matches 60; Conserv

```
CC their corresponding DNA molecules. An immunogen comprises a portion of CC gag protein of HIV from an HIV clade, parts of p17 and p24, modified to CC prevent N-terminal myristcylation; and a synthetic polypeptide comprising CC human cytotoxic T-lymphocyte (CTL) epitopes of HIV protein. This CC immunogen is designed to elicit an HIV-specific immune response in CC humans. The immunogen is useful in the preparation of a medicament such CC as vaccine to prevent or treat HIV infection in a human subject. The CC in a human subject which comprises administering one or more times an amount of nucleic acid molecule sufficient to prime an immune response to the immunogen, or else may be packaged within a delivery means, such as a CC modified vaccinia virus Ankara (MVA) to boost the immune response to CC common portion of the immunogens. The present DNA sequence encodes human CC immunodeficiency virus TA immunogen (HIV TA) fusion protein construct. CC CONSISTS of about 73% of gag protein fused to a string of 25 partially CC overlapping human CTL epitopes. The gag domain of HIV A immunogen CC includes the HIV-1 clade A tat sequence positioned between the gag CC pricein and synthetic human CTL epitopes.
                                    protein and synthetic human CTL epitopes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel immunogen for stimulating anti-HIV immune response, has a portion of gag protein of HIV from HIV clade, parts of p17, p24 and synthetic polypeptide comprising human cytotoxic T-lymphocyte epitopes of HIV

                                                                                                                                                                                                                                                                                                                                                                                                                                 S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  CC their corresponding DNA molecules. An immunogen comprises a portion of CC gag protein of HIV from an HIV Clade, parts of p17 and p24, modified to CC prevent N-terminal myristoylation; and a synthetic polypeptide comprising CC human cytotoxic T-lymphocyte (CTL) epitopes of HIV protein. This CC immunogen is designed to elicit an HIV-specific immune response in CC immunogen is designed to elicit an HIV-specific immune response in CC invention also relates to method of stimulating anti-HIV immune response CC in a human subject which comprises administering anti-HIV immune response to CC in a human subject which comprises administering one or more times an CC modified vaccinia virus Ankara (MVA) to boost the immunogen, or else may be packaged within a delivery means, such as a CC modified vaccinia virus Ankara (MVA) to boost the immune response to CC immunodeficiency virus Arkara (MVA) to boost the immune cancodes human CC immunodeficiency virus Arkara (MVA) to boost the immune response to CC complete of about 73% of gag protein fused to a string of 25 partially coverlapping human CTL epitopes. The gag domain of HIV A contains p24 and CC veriapping human CTL epitopes. The gag domain of HIV A contains p24 and CC comprises the same design rationals with HIV A construct, but additionally includes the HIV-1 clade A tat sequence which is present on CC conditionally includes the HIV-1 clade A tat sequence which is present on CC conditionally includes the HIV-1 clade A tat sequence which is present on CC conditionally includes the HIV-1 clade A tat sequence which is present on the virus and sequence which is present on the sequence

                                                                                                                                                                                                                                                                                                                 CC their corresponding DNA molecules. An immunogen comprises a portion of CC gag protein of HIV from an HIV clade, parts of p17 and p24, modified to CC prevent N-terminal myristoylation; and a synthetic polypeptide comprising CC immunogen is designed to elicit an HIV-specific immune response in CC immunogen is designed to elicit an HIV-specific immune response in CC immunogen is designed to elicit an HIV-specific immune response in CC in a human subject which comprises administering one or more times an CC in a human subject which comprises administering one or more times an CC amount of nucleic acid molecule sufficient to prime an immune response to the immunogen, or else may be packaged within a delivery means, such as a CC common portion of the immunogen. The present DNA sequence encodes human CC construct is based on HIV A immunogen fusion protein construct. PPA CC construct is based on HIV A immunogen. The HIV A immunogen consists of CC about 73% of gag protein fused to a string of 25 partially overlapping CC manned celling rationale with HIV A construct, but additionally includes the CC HIV-1 clade A tat sequence, C-pol protein, N-pol protein, rev and nef CC proteins
                                                                                                                                                                                                              Matches

```

Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      99WO-US031273
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                60
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                BP
```

Polynucleotide encoding antigenic type C HIV Gag polypeptide or a HIV Env polypeptide and the polypeptide useful for immunizing a mammal especially human against HIV.

WPI; 2000-452401/39.

Barnett S,

Zur Megede

ď

Claim 1; Page 92; 113pp; English.

Expression cassettes comprising a polynucleotide encoding antigenic type C human immunodeficiency virus (HIV) Gag or Env polypeptides are useful in DNA immunization, generation of packaging cell lines and production of Gag- and/or Env-containing proteins. Symthetic Env and Gag expression cassettes exhibit increased potency for induction of cytotoxic T-lymphocyte (CTL) responses by DNA immunization. Gag of HIV-1 self-assemble into non-infectious virus-like particles which are used as a assemble into non-infectious virus-like particles which are used as a for the proper presentation of an antigen entrapped or associated immune system of the host ō,

                                                                                                                                                                                                                                                                                                                               The present invention describes expression cassettes comprising a polymucleotide sequence encoding a polypeptide comprising immunogenic HIV type C polypeptides. The expression cassettes comprise any of the HIV type C sequences encoding Gag, Pol, Vif, Vpr, Tat, Rev, Vpu, Env or Nef (I). (I) have immunostimulant activity and can be used in gene therapy. The HIV type C polynucleotides are useful in applications including DNA immunisation, generation of packaging cell lines, and production of HIV Type C proteins. The polynucleotides are particularly useful in gene therapy and DNA immunisation applications. ABL39942 to ABL40054 and ABB06204 to ABB06215 represent sequences used in the exemplification of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New polynucleotides encoding antigenic HIV Type C polypeptides, useful in applications including DNA immunization or generation of packaging cell lines, particularly in gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human immunodeficiency virus; type C.
